

# Collecting Data

- Ranked: ordered or scaled data
- Quantitative: measurements or counts
  - Discontinuous: whole numbers
  - Continuous: non whole numbers
- Qualitative: non numerical, descriptive
  - Sex, color, presence of...

# Graphs

- SCATTER GRAPH
  - No independent variable
  - Points are not connected
  - Use of a “best fit” line
  - Data must be continuous for both variables
  - Helpful in determining relationships between variables

- Scatter graph

# Graphs

- LINE GRAPH

- Used when one variable (independent) affects another variable (dependent)
- Data must be continuous for both
- Connect the dots or a best fit line

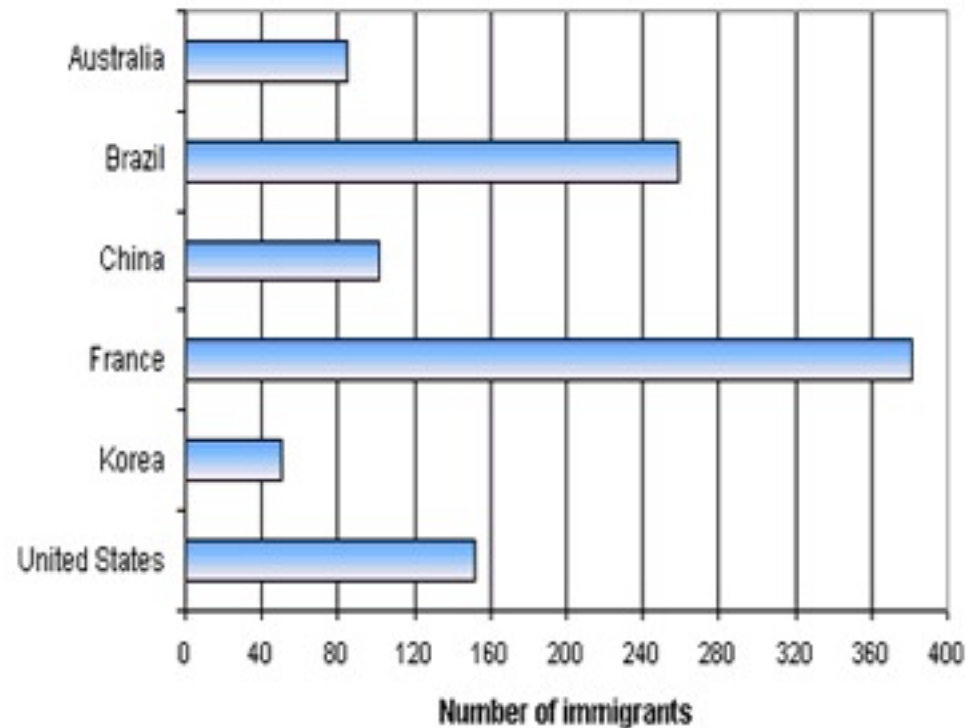

- Line Graph

# Graphs

- BAR GRAPH
  - Non numerical data and discontinuous data for at least one variable
  - No independent and dependent variables

- Bar graph

# Graphs

- HISTOGRAMS

- Plots continuous data against a frequency of occurrence
- X axis is class interval
- Y axis is frequency interval
- \*Column graphs are the same except data is discontinuous therefore bars will not touch

- Column graph

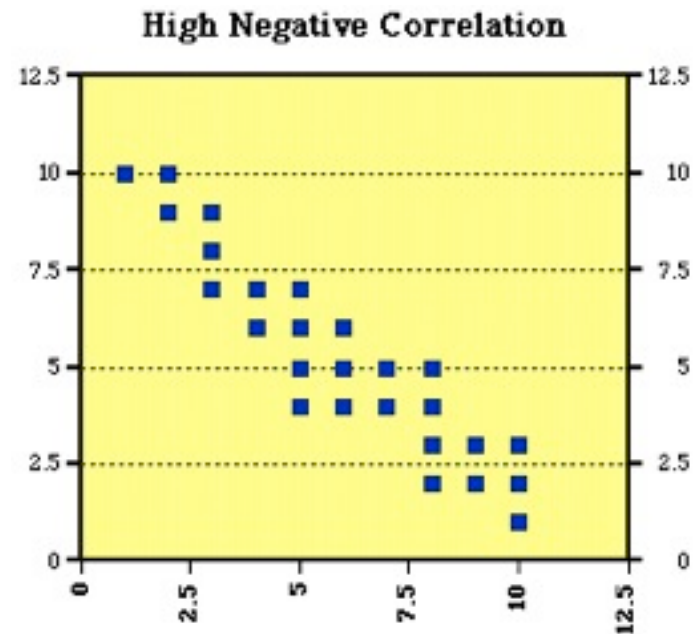

# Correlations

- Positive or Direct Correlation
  - One variable increases or decreases with another variable
- Draw Best Fit Line

# Correlations

- Negative or Indirect or Inverse correlation
  - As one variable increases the other decreases and vice versa
- Draw Best Fit Line

# No Correlation

- No correlation exists when plots are randomly distributed throughout the graph
  - Best fit lines are not possible
- No Best Fit Line

# Graph Interpretation

Transpiration Rate vs. Windspeed

Root Uptake vs. Relative Humidity

Body Temperature vs Air Temperature

photosynthetic rate vs light intensity

Enzyme activity vs. pH

Human Population number vs. time

# Analyzing Data

- Mode
  - The data that occurs most frequently
- Range
  - The difference between the lowest and highest data
- Mean
  - Numerical average
    - Add all data and divide by the number data points
- Median
  - The middle data value
    - Rank the data from low to high
    - If data set has an even number of data then the median is the average of the the two middle data

# Analyzing Data

- Standard Deviation
  - measure of distribution of scores
  - computed by
    - **calculating the deviation of each score from the mean**
    - **squaring those deviations**
    - **finding their average**
    - **finding the square root of this average**
